

1 **Clinical Practice Guideline:** **Unhealthy Alcohol / Substance Use Screening and**
 2 **Intervention**

3
 4 **Date of Implementation:** **April 19, 2012**

5
 6 **Product:** **Specialty**
 7

8
 9 **GUIDELINES**

10 Unhealthy alcohol / substance use screenings and interventions by an appropriately trained
 11 healthcare professional are established as clinically effective, are professionally
 12 recognized, and have a favorable benefit: risk profile.

13
 14 **INTRODUCTION**

15 Unhealthy alcohol use encompasses a wide range of behaviors, from drinking above the
 16 recommended limits (i.e., risky drinking) to alcohol use disorder (AUD) (e.g., harmful
 17 **alcohol use, abuse, or dependence**). Types of unhealthy alcohol use and related terms are
 18 numerous and are not mutually exclusive. Examples include Risky/At-risk use, Excessive
 19 use, Harmful use, and Alcohol use disorder; for example, persons with AUD may also meet
 20 criteria for harmful use. The National Institute on Alcohol Abuse and Alcoholism
 21 (NIAAA) defines “risky use” as exceeding the recommended limits of 4 drinks per day (56
 22 g/d based on the US standard of 14 g/drink) or 14 drinks per week (196 g/d) for healthy
 23 adult men aged 21 to 64 years or 3 drinks per day or 7 drinks per week (42 g/d or 98 g/week)
 24 for all adult women of any age and men 65 years or older. Excessive alcohol use is defined
 25 by the CDC as binge drinking ($\geq 5/4$ drinks per occasion for men/women), heavy drinking
 26 ($\geq 15/8$ drinks per week for men/women), and any alcohol use by people younger than age
 27 21 years and by pregnant women. Per the NIAAA, examples of a standard drink include a
 28 12-oz beer (5% alcohol), 5 oz of wine (12% alcohol), or 1.5 oz of distilled spirits (40%
 29 alcohol).

30
 31 Substance-related disorders are characterized by specific behavioral and physical
 32 symptoms, often including withdrawal, tolerance, and craving (DSM-V). The causes of
 33 substance-related disorders are multifaceted involving genetic, neurobiological, and
 34 psychosocial factors. The early signs of substance-related disorders may not always be
 35 evident to health care practitioners, but unhealthy substance use screening can help identify
 36 impaired control, social impairment, risky use, and pharmacological criteria. Treatment
 37 frequently involves detox, individual or group counseling, and/or medications, however,
 38 prevention of the development of substance-related disorders is preferred to reduce
 39 healthcare costs and human suffering (National Institute on Alcohol Abuse and
 40 Alcoholism, 2021).

USPSTF SCREENING RECOMMENDATIONS

Unhealthy Alcohol Use (2018)

Grade B Recommendation: The U.S. Preventive Services Task Force (USPSTF) recommends screening for unhealthy alcohol use in primary care settings in adults 18 years or older, including pregnant women, and providing persons engaged in risky or hazardous drinking with brief behavioral counseling interventions to reduce unhealthy alcohol use.

Grade I Recommendation: The USPSTF concludes that the current evidence is insufficient to assess the balance of benefits and harms of screening and brief behavioral counseling interventions for alcohol use in primary care settings in adolescents aged 12 to 17 years.

Unhealthy Drug Use (2020)

Grade B Recommendation: The USPSTF recommends screening by asking questions about unhealthy drug use in adults age 18 years or older. Screening should be implemented when services for accurate diagnosis, effective treatment, and appropriate care can be offered or referred. (Screening refers to asking questions about unhealthy drug use, not testing biological specimens.)

Grade I Recommendation: The USPSTF concludes that the current evidence is insufficient to assess the balance of benefits and harms of screening for unhealthy drug use in adolescents.

Grade B Recommendation: The USPSTF recommends the service. There is high certainty that the net benefit is moderate or there is moderate certainty that the net benefit is moderate to substantial.

Grade I Recommendation: The USPSTF concludes that the current evidence is insufficient to assess the balance of benefits and harms of the service. Evidence is lacking, of poor quality, or conflicting, and the balance of benefits and harms cannot be determined.

UNHEALTHY ALCOHOL USE

Benefits of Early Detection and Behavioral Counseling:

The USPSTF found no studies that directly evaluated whether screening for unhealthy alcohol use in primary care settings in adolescents and adults, including pregnant women, leads to reduced unhealthy alcohol use; improved risky behaviors; or improved health, social, or legal outcomes.

The USPSTF found adequate evidence that brief behavioral counseling interventions in adults who screen positive are associated with reduced unhealthy alcohol use. There were reductions in both the odds of exceeding recommended drinking limits and heavy use episodes at 6- to 12-month follow-up. In pregnant women, brief counseling interventions increased the likelihood that women remained abstinent from alcohol use during pregnancy. The magnitude of these benefits is moderate. Epidemiologic literature links

1 reductions in alcohol use with reductions in risk for morbidity and mortality and provides
 2 indirect support that reduced alcohol consumption may help improve some health
 3 outcomes.

4
 5 The USPSTF found inadequate evidence that brief behavioral counseling interventions in
 6 adolescents were associated with reduced alcohol use. However, no harms were noted for
 7 brief behavioral counseling in the evidence.

8 9 Screening Tools—Unhealthy Alcohol Use:

10 Of the available screening tools, the USPSTF determined that 1- to 3-item screening
 11 instruments have the best accuracy for assessing unhealthy alcohol use in adults 18 years
 12 or older.¹ These instruments include the abbreviated Alcohol Use Disorders Identification
 13 Test–Consumption (AUDIT-C) and the NIAAA-recommended Single Alcohol Screening
 14 Question (SASQ). When patients screen positive on a brief screening instrument (e.g.,
 15 SASQ or AUDIT-C), clinicians should ensure follow-up with a more in-depth risk
 16 assessment to confirm unhealthy alcohol use and determine the next steps of care. Evidence
 17 supports the use of brief instruments with higher sensitivity and lower specificity as initial
 18 screening, followed by a longer instrument with greater specificity (e.g., AUDIT). The
 19 AUDIT has 10 questions: 3 questions covering frequency of alcohol use, typical amount
 20 of alcohol use, and occasions of heavy use, and 7 questions on the signs of alcohol
 21 dependence and common problems associated with alcohol use (e.g., being unable to stop
 22 once you start drinking). It requires approximately 2 to 5 minutes to administer.^{1, 12} If
 23 AUDIT is used as an initial screening test, clinicians may use a lower cutoff (such as 3, 4,
 24 or 5) to balance sensitivity and specificity in screening for the full spectrum of unhealthy
 25 alcohol use.

26 27 Behavioral Counseling Interventions:

28 Behavioral counseling interventions for unhealthy alcohol use vary in their specific
 29 components, administration, length, and number of interactions. They may include
 30 cognitive behavioral strategies, such as action plans, drinking diaries, stress management,
 31 or problem solving. Interventions may be delivered by face-to-face sessions, written self-
 32 help materials, computer- or Web-based programs, or telephone counseling. For the
 33 purposes of this recommendation statement, the USPSTF uses the following definitions of
 34 intervention intensity: very brief single contact (≤ 5 minutes), brief single contact (6 to 15
 35 minutes), brief multicontact (each contact is 6 to 15 minutes), and extended multicontact
 36 (≥ 1 contact, each > 15 minutes). Thirty percent of the interventions reviewed by the
 37 USPSTF were web-based. Nearly all of the interventions consisted of 4 or fewer sessions;
 38 the median number of sessions was 1 (range, 0-21). The median length of time of contact
 39 was 30 minutes (range, 1-600 minutes). Most of the interventions had a total contact time
 40 of 2 hours or less. Primary care settings often used the Screening, Brief Intervention, and
 41 Referral to Treatment (SBIRT) approach. Most interventions involved giving general
 42 feedback to participants (e.g., how their drinking fits with recommended limits, or how to

1 reduce alcohol use). The most commonly reported intervention component was use of
 2 personalized normative feedback sessions, in which participants were shown how their
 3 alcohol use compares with that of others; more than half of the included trials and almost
 4 all trials in young adults used this technique. Personalized normative feedback was often
 5 combined with motivational interviewing or more extensive cognitive behavioral
 6 counseling. Other cognitive behavioral strategies, such as drinking diaries, action plans,
 7 alcohol use “prescriptions,” stress management, or problem solving were also frequently
 8 used. The USPSTF was unable to identify specific intervention characteristics or
 9 components that were clearly associated with improved outcomes.

10 **UNHEALTHY DRUG USE**

11 **Screening Tools**

12 Several screening tools that ask questions about drug use are available for identifying 1 or
 13 more classes of unhealthy drug use, the frequency or severity of use, or drug-related health,
 14 social, or legal consequences that characterize unhealthy use or drug use disorders.
 15 Interviewer-administered tools and self-administered tools appear to have similar accuracy.
 16 Screening tools are not meant to diagnose drug dependence, abuse, addiction, or drug use
 17 disorders. Patients with positive screening results may, therefore, need to be offered or
 18 referred for diagnostic assessment. Brief tools (e.g., NIDA [National Institute on Drug
 19 Abuse] Quick Screen, which asks 4 questions about use of alcohol, tobacco, nonmedical
 20 use of prescription drugs, and illegal drugs in the past year) may be more feasible in busy
 21 primary care settings, but longer tools (e.g., the 8-item ASSIST [Alcohol, Smoking and
 22 Substance Involvement Screening Test]) that assess risks associated with unhealthy drug
 23 use or comorbid conditions may reveal information signaling the need for prompt
 24 diagnostic assessment. Tools with questions about nonmedical use of prescription drugs
 25 (e.g., TAPS [Tobacco, Alcohol, Prescription Medication, and Other Substance Use]) may
 26 be useful when clinicians are concerned about prescription misuse. One study reported that
 27 drug use questions in the PRO (Prenatal Risk Overview) risk assessment tool were
 28 reasonably accurate for identifying drug abuse or dependence in pregnant women.
 29

30 **CPT Code and Documentation Requirements to Substantiate Medical Necessity**

31 When performing an Alcohol/Substance Screening and Intervention (CPT codes 99408 and
 32 99409) the documentation in the medical records should identify the use of a validated
 33 and/or standardized screening questionnaire and the nature and character of the
 34 intervention. Please see the Practitioner Resource section below for examples of screening
 35 and intervention guidelines.
 36

37
 38 Medical record documentation should reflect what screening tools were utilized and that
 39 the results were reviewed with the patient. The practitioner should provide feedback on the
 40 screening results, advice on safe consumption limits and recommendations about behavior
 41 change.

1 If unhealthy substance use is identified through the screening process, the practitioner
 2 should provide, at a minimum, feedback about screening results and advice on safe
 3 consumption limits and recommended behavior change. A referral for chemical
 4 dependency treatment should also be offered or patient’s response and plan documented.

16 **Member Resources**

17 Educating patients about substance abuse disorders, treatment options and available
 18 resources can assist the recovery process. Publicly available resources can be found at:

- 19 • Substance Abuse & Mental Health Services (<https://www.samhsa.gov/>)
- 20 • National Institute on Alcohol Abuse and Alcoholism (<https://www.niaaa.nih.gov>)

22 **PRACTITIONER SCOPE AND TRAINING**

23 Practitioners should practice only in the areas in which they are competent based on their
 24 education, training and experience. Levels of education, experience, and proficiency may
 25 vary among individual practitioners. It is ethically and legally incumbent on a practitioner
 26 to determine where they have the knowledge and skills necessary to perform such services
 27 and whether the services are within their scope of practice.

29 It is *best practice* for the practitioner to appropriately render services to a patient only if
 30 they are trained to competency, equally skilled, and adequately competent to deliver a
 31 service compared to others trained to perform the same procedure. If the service would be
 32 most competently delivered by another health care practitioner who has more skill and
 33 training, it would be best practice to refer the patient to the more expert practitioner.

35 *Best practice* can be defined as a clinical, scientific, or professional technique, method, or
 36 process that is typically evidence-based and consensus driven and is recognized by a
 37 majority of professionals in a particular field as more effective at delivering a particular
 38 outcome than any other practice (Joint Commission International Accreditation Standards
 39 for Hospitals, 2020).

41 Depending on the practitioner’s scope of practice, training, and experience, a patient’s
 42 condition and/or symptoms during examination or the course of treatment may indicate the

1 need for referral to another practitioner or even emergency care. In such cases it is essential
 2 for the practitioner to refer the patient for appropriate co-management (e.g., to their primary
 3 care physician) or if immediate emergency care is warranted, to contact 911 as appropriate.
 4 See the *Managing Medical Emergencies in a Health Care Facility (CPG 159 – S)* clinical
 5 practice guideline for information.
