16 Rehabilitation Services (Speech, Physical, and Occupational

17 Therapy)

18  
19 **GUIDELINES**

20 Pediatric developmental delay screening is medically necessary at 6, 12, 18 or 24, 36, 48,  
21 and 60 months of age, or if concerns are raised by the parents during routine visits and the  
22 practitioner substantiates these additional developmental delay screening tests are  
23 necessary for treatment planning. Screening with the Modified Checklist for Autism in  
24 Toddlers (MCHAT) for autism is recommended to take place at 18 and 24 months.

25  
26 Pediatric developmental delay screening **must include all of the following:**

- 27     1. A validated screening tool is utilized; and  
28     2. The tool is used in its entirety; using a subset of items is considered invalid; and  
29     3. Medical records document the screening tool is scored and a **separate** identifiable  
30     report is prepared (standard evaluation documentation is not sufficient); and  
31     4. Practitioners are educated and competent in screening of developmental delays.

32  
33 Pediatric developmental delay testing is indicated if screening demonstrates the possibility  
34 of disability and further assessment is required.

35  
36 Pediatric developmental delay screening is NOT medically necessary if:

- 37     1. Pediatric developmental delay screening and/or testing does not meet the above  
38     criteria.  
39     2. Preventative counseling is provided for developmental delay risk factor reduction.  
40     3. The service is provided for the administration of health risk assessment tools, which  
41     are not considered applicable for developmental delay screening or testing.

1 **CPT/HCPCS CODES AND DESCRIPTIONS**

CPT®/HCPCS Code	CPT®/HCPCS Code Description
96110	Developmental screening (e.g., developmental milestone survey, speech and language delay screen), with scoring and documentation, per standardized instrument
96112	Developmental test administration (including assessment of fine and/or gross motor, language, cognitive level, social, memory and/or executive functions by standardized developmental instruments when performed), by physician or other qualified health care professional, with interpretation and report; first hour
96113	Developmental test administration (including assessment of fine and/or gross motor, language, cognitive level, social, memory and/or executive functions by standardized developmental instruments when performed), by physician or other qualified health care professional, with interpretation and report, each additional 30 minutes (List separately in addition to code for primary procedure)
96127	Brief emotional/behavioral assessment (e.g., depression inventory, attention-deficit/hyperactivity disorder [ADHD] scale), with scoring and documentation, per standardized instrument
G0451	Development testing, with interpretation and report, per standardized instrument form

2

3 **BACKGROUND**

4 According to the Center for Disease Control and Prevention (CDC), approximately 13%  
5 of children aged 3 to 17 in the United States have a developmental or behavioral disability  
6 such as autism, intellectual disability and attention-deficit/hyperactivity disorder. In  
7 addition, many children have delays in language or other areas that can affect development  
8 of critical life skills and school readiness. However, fewer than half of children with  
9 developmental delays are identified before starting school, by which time significant  
10 problems have already occurred and opportunities for treatment might have been missed.  
11 Early identification is required by federal law.

12

13 The Individuals with Disabilities Education Act (IDEA) Amendments of 1997 mandate the  
14 “early identification of, and intervention for developmental disabilities through the  
15 development of community-based systems.” This law requires physicians to refer children  
16 with suspected developmental delays to appropriate early intervention services in a timely

1 manner. All states receive federal funding to provide appropriate intervention through  
 2 infant and child-find programs for children with developmental delays.

3  
 4 The American Association of Family Physicians (AAFP) and the American Academy of  
 5 Pediatricians (AAP) agree that developmental delay screening is a necessary part of every  
 6 child’s medical evaluation. The American Academy of Pediatrics recommends  
 7 surveillance at all well-child visits, combined with standardized screening for  
 8 developmental delay at nine, 18, and 30 months of age, as well as at every well-child visit  
 9 when developmental delay is suspected. Surveillance is the ongoing process of identifying  
 10 children who may be at risk of developmental delays, and screening” is the use of  
 11 standardized tools at specific intervals to support and refine the risk. Surveillance is  
 12 considered integral to the regular well child Evaluation and Management (E/M) service  
 13 would not be a separately billable service when performed. Screening may be billed  
 14 separately from the regular E/M service. If more than one screening tool is completed in a  
 15 single visit, it would be appropriate coding practice to use modifier -59 applied to each  
 16 claim line; however, coverage policy regarding modifier codes will vary and does not  
 17 guarantee coverage or payment. Many screening tools are now available online and are  
 18 printed in a number of different languages. Screening tools should have established  
 19 psychometric qualities, such as sensitivity, specificity, and positive/negative predictive  
 20 power. There are a variety of available screening tools that meet these criteria. Children  
 21 whose screening scores demonstrate possible disability should receive more intensive  
 22 assessment for the diagnosis of potential developmental delays. This involves testing to  
 23 measure cognitive, motor, social, language, adaptive, and/or cognitive abilities using  
 24 provider standardized tests. The results of a developmental delay test may determine if the  
 25 child is in need of early intervention services and/or a treatment plan. Research shows that  
 26 early intervention treatment services can greatly improve a child’s development. Early  
 27 intervention services help children from birth through 3 years of age (36 months) learn  
 28 important skills. Services include therapy to help the child talk, walk, and interact with  
 29 others. Developmental delay testing is an in-depth assessment of a child’s skills and should  
 30 be administered by a trained and credentialed professional.

31  
 32 Preventative counseling for risk factor reduction and the administration of health risk  
 33 assessment tools represent other clinical services and are not considered equivalent to  
 34 developmental delay screening or testing.

35  
 36 The following tools are considered to be valid and reliable:

- 37 1. Parents’ Evaluation of Developmental Status (PEDS)
- 38 2. The Age and Stages Questionnaire (ASQ) system (formerly known as the Infant  
 39 Monitoring Questionnaires)
- 40 3. Children’s Developmental Inventory (CDI)
- 41 4. The Battelle Developmental Inventory Screening Test (BDIST)

- 1       5. The Bayley Infant Neurodevelopmental Screener (BINS)  
 2       6. Modified Checklist for Autism in Toddlers (M-CHAT)

### 4       **PRACTITIONER SCOPE AND TRAINING**

5       Practitioners should practice only in the areas in which they are competent based on their  
 6       education training and experience. Levels of education, experience, and proficiency may  
 7       vary among individual practitioners. It is ethically and legally incumbent on a practitioner  
 8       to determine where they have the knowledge and skills necessary to perform such services.

9  
 10      It is best practice for the practitioner to appropriately render services to a patient only if  
 11      they are trained, equally skilled, and adequately competent to deliver a service compared  
 12      to others trained to perform the same procedure. If the service would be most competently  
 13      delivered by another health care practitioner who has more skill and expert training, it  
 14      would be best practice to refer the patient to the more expert practitioner.

15  
 16      Best practice can be defined as a clinical, scientific, or professional technique, method, or  
 17      process that is typically evidence-based and consensus driven and is recognized by a  
 18      majority of professionals in a particular field as more effective at delivering a particular  
 19      outcome than any other practice (Joint Commission International Accreditation Standards  
 20      for Hospitals, 2020).

21  
 22      Depending on the practitioner’s scope of practice, training, and experience, a patient’s  
 23      condition and/or symptoms during examination or the course of treatment may indicate the  
 24      need for referral to another practitioner or even emergency care. In such cases it is essential  
 25      for the practitioner to refer the patient for appropriate co-management (e.g., to their primary  
 26      care physician) or if immediate emergency care is warranted, to contact 911 as appropriate.  
 27      See the *Managing Medical Emergencies (CPG 159 – S)* clinical practice guideline for  
 28      information.
